

Hisna's Asset Inventory

Asset ID	Asset Name	Asset Description	Category	Sensitivity	Priority (C/I/A)	Value / impact if compromised	Who would target it
A001	Donation boxes (simulated)	Simulated IoT devices that send signed events to the backend	Device	Internal	Integrity	Forged/altered events could hide a real theft or raise false alarms	Outside thief, network attacker
A002	Box secret keys (HMAC keys)	Per-box secret used to sign and verify every box message	Secret / Credential	Secret	Confidentiality	If leaked, an attacker can impersonate any box completely	Insider, DB attacker, eavesdropper
A003	JWT/tokens	Every successful login, a new token is created and associated with an operator	Secret token	Secret	Confidentiality	An attacker steals a token for operator then attacker can see and do the same functions of an operator	Insider, eavesdropper, network attacker
A004	database	A database that contains encrypted passwords, hashed token, and audit log.	Secret database	Secret	Confidentiality, integrity, availability	An attacker might find a way to break the encryption and restore the passwords	DB attacker
A005	Audit log	It contains the successful/unsuccessful events	records	Confidential	integrity	Attacker can remove his digital fingerprints	Any attacker that could cause a digital harm
A006	Dashboard	A dashboard that shows boxes status	software	Confidential	Integrity, availability	If compromised attacker can know each box status and may target the vulnerable boxes	Outside theft
A007	Operator credentials	Username and password for an operator	Secret credentials	Secret	Confidentiality	If leaked, attacker can view the dashboard, open the box and change its status.	Any attacker that could cause a digital harm
A008	Backend server / API	The running system itself	software	Confidential	Confidentiality, integrity, availability	Attacker can do anything he wants with the system, include all malicious activities that could happen.	outside attacker / anyone seeking full control
